

## Homework Assignment 2

Due: Friday, February 5

1. Let  $m \in \mathbb{N}$  be a natural number. Recall that the *residue of an integer  $x$  modulo  $m$*  is the remainder  $r$  when applying the division algorithm (HW1 #8) to divide  $x$  by  $m$ . We say that integers  $x$  and  $y$  are *congruent modulo  $m$*  if they have the same residue modulo  $m$ .

- (a) Show that  $x$  and  $y$  have the same residue modulo  $m$  if and only if  $m$  divides  $x - y$ .  
 (b) Show that congruence modulo  $m$  is an equivalence relation on  $\mathbb{Z}$ .  
 (c) Suppose  $a \equiv a' \pmod{m}$  and  $b \equiv b' \pmod{m}$ . Show that:

$$a + b \equiv a' + b' \pmod{m} \quad \text{and} \quad ab \equiv a'b' \pmod{m}.$$

2. (a) Let  $p$  be a prime number, and let  $x, y \in \mathbb{Z}/p\mathbb{Z}$  be nonzero. Show that  $xy$  is also nonzero.  
 (b) On the other hand, let  $m$  be a composite number greater than 3. Show that one can always find two nonzero elements of  $\mathbb{Z}/m\mathbb{Z}$  whose product is zero.

3. Fix a natural number  $m$ .

- (a) Let  $x, y \in (\mathbb{Z}/m\mathbb{Z})^\times$ . Show that  $xy \in (\mathbb{Z}/m\mathbb{Z})^\times$ .  
 (b) Show that  $(\mathbb{Z}/m\mathbb{Z})^\times$  is a group under multiplication modulo  $m$ .  
 (c) Compute the order of each element of  $(\mathbb{Z}/7\mathbb{Z})^\times$

4. Let  $*$  denote multiplication modulo 15, and consider the set  $\{3, 6, 9, 12\}$ . Fill in the following multiplication table.

*	3	6	9	12
3				
6				
9				
12				

Use the table to prove that  $(\{3, 6, 9, 12\}, *)$  is a group. What is the identity element?

5. Let  $A$  be a nonempty set, and define  $S_A := \{f : A \rightarrow A \mid f \text{ is bijective}\}$ . Define a binary operation by composition  $f * g := f \circ g$ . Show that  $S_A$  is a group. We will call this the *permutation group of  $A$* .  
 6. Let  $(A, *)$  and  $(B, \cdot)$  be two groups. Define multiplication on the Cartesian product  $A \times B$  via the following rule:

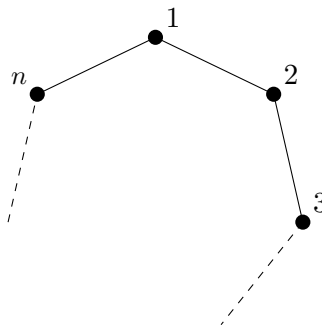

$$(a_1, b_1)(a_2, b_2) = (a_1 * a_2, b_1 \cdot b_2).$$

Show that this makes  $A \times B$  into a group. We call this group the *direct product of  $A$  and  $B$* .

7. Fix elements  $x, y$  of a group  $G$ .

- (a) Show that if  $xy = e$  then  $x^{-1} = y$  and  $y^{-1} = x$ .  
 (b) Show that  $(xy)^{-1} = y^{-1}x^{-1}$ .  
 (c) Show that  $(x^n)^{-1} = x^{-n}$ .

8. Fix an element  $x$  of a group  $G$  and suppose  $|x| = n$ .
- Show that  $x^{-1}$  is a nonnegative power of  $x$ .
  - Show that the all of  $1, x, x^2, \dots, x^{n-1}$  are distinct. Conclude that  $|x| \leq |G|$ . (We will later show that if  $|G|$  is finite then  $|x|$  divides  $|G|$ .)
  - Show that  $x^i = x^j$  if and only if  $i \equiv j \pmod n$ .
9. In class we developed the theory of the group  $D_{12}$  of rigid symmetries of the regular hexagon. In fact, everything we developed should go through almost exactly the same way for  $D_{2n}$ : the rigid symmetries of regular  $n$ -sided polygon, pictured below:

- Explain why  $D_{2n}$  is a group under composition of symmetries.
- Show that there are exactly  $2n$  rigid symmetries of the regular  $n$ -gon.
- Let  $r$  be the rotation by  $2\pi/n$  in the clockwise direction, and  $s$  be the reflection along the vertical line going through the vertex labelled '1'. Compute the elements of  $D_{2n}$  in terms of  $r$  and  $s$  in the following steps:
  - Compute the order of  $r$  and  $s$  (justifying your answers).
  - Let  $i_1, i_2 \in \{0, 1\}$  and  $j_1, j_2 \in \{0, 1, \dots, n-1\}$ . Show that:

$$s^{i_1} r^{j_1} = s^{i_2} r^{j_2} \text{ if and only if } i_1 = i_2 \text{ and } j_1 = j_2.$$

(Hint: You could first show  $s \neq r^i$  for any  $i$  using geometry. The rest of the cases should follow from this and part (i) by using cancellation and 8(b).)

- Conclude that  $D_{2n} = \{s^i r^j \mid i = 0, 1 \text{ and } j = 0, 1, \dots, n-1\}$ . In particular,  $r$  and  $s$  generate  $D_{2n}$ .
- Show that  $rs = sr^{-1}$ . Deduce inductively from this that  $r^n s = sr^{-n}$  for all  $n$ .

We now completely understand the algebraic structure of  $D_{2n}$ . In particular, we know what every element looks like (in terms of  $r$  and  $s$ ) by (c), and we know how to multiply any two elements using the relation in part (d). We summarize this by saying that  $D_{2n}$  has the following presentation:

$$D_{2n} = \langle r, s \mid r^n = s^2 = 1, rs = sr^{-1} \rangle.$$

- Use this presentation to give an algebraic proof that every element which is not a power of  $r$  has order 2.
- Bonus: Can you give a geometric interpretation of part (e)?
